## Fluorescent Pigments

### 基本系列与应用 General grades applications

荧光颜料可以吸收紫外光或者可见光波段中短波长的并以较长波长的光发射，这部分发射光通常在可见光波段内，并形成人眼可见的颜色。因此荧光颜料具有无可比拟的亮度和鲜艳度，可达到普通颜料的3倍。

荧光颜料通常是由载体树脂与荧光染料构成的。通过将荧光染料溶解到合成的载体树脂并研磨到微米级粒径，就形成了可作为着色剂使用的荧光颜料。

Fluorescent pigments can absorb the light of short wavelengths, either in the ultraviolet or visible regions of the spectrum, and re-emit at longer wavelengths. The re-emission occurs within the visible region of the spectrum, resulting in color. Therefore, fluorescent colors can be up to 3 times brighter than conventional colors. Fluorescent pigments are composed of a solid state solution of fluorescent dyes in polymeric resin, which is then ground into fine powder for use as a pigment or colorant.
